Accelerator Physics Center

Summary of Particle Production Yield Studies for Project-X Kaon Experiments

Nikolai Mokhov and Konstantin Gudima

4th Workshop on Physics
with a High-Intensity Proton Source
Fermilab, November 9-10, 2009

OUTLINE

- LAQGSM Model in MARS15 Code
- Benchmarking of Kaon Yields for pp, pd and pC
- Total and Fractional Yields vs Beam Energy T_p for pp, pd and pC at $1.5 < T_p < 10$ GeV
- Momentum, Angular and Double-Differential Distributions for pp and pd at $T_p = 3$ and 8 GeV
- Summary

LAQGSM

LAQGSM is an improved version [1] of the time-dependent Dubna intranuclear Cascade Model, DCM [2], combined with isobar model at $E < 4.5$ GeV and Quark Gluon String Model (QGSM) [3] for elementary interactions inside nucleus at $E > 4.5$ GeV, coupled with Fermi breakup, coalescent and generalized evaporation-fission [4] models.

LAQGSM in MARS15

The Los Alamos Quark-Gluon String Model code, LAQGSM03.03, has been enhanced over last several months in the intermediate 2 to 8 GeV region of interest for Project X experiments.

It is used in the MARS15 code for photon, hadron and heavy-ion projectiles at a few MeV/A to about a few TeV/A, providing a power of full theoretically consistent modeling of exclusive and inclusive distributions of secondary particles, spallation, fission, and fragmentation products in realistic experimental setups.

Production of K , Λ , and Σ in LAQGSM

In the LAQGSM code K , Λ , and Σ are produced via the following channels:

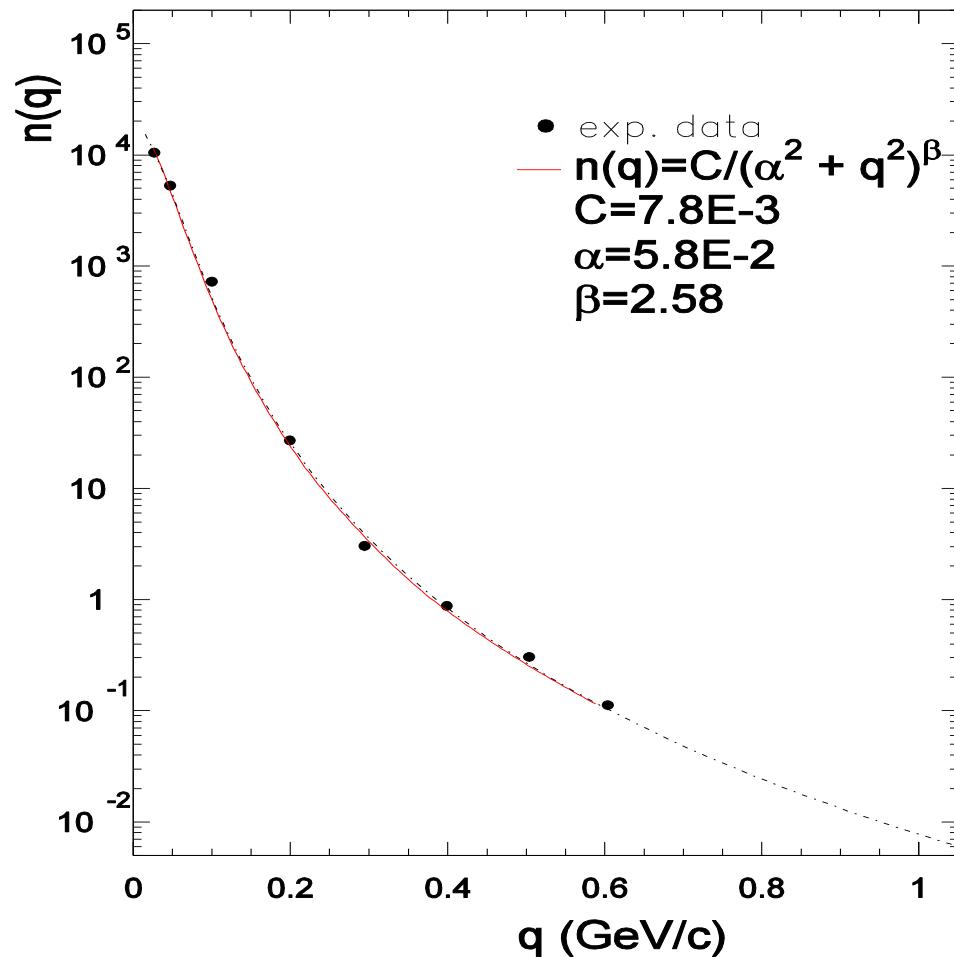

p + d Reaction in LAQGSM

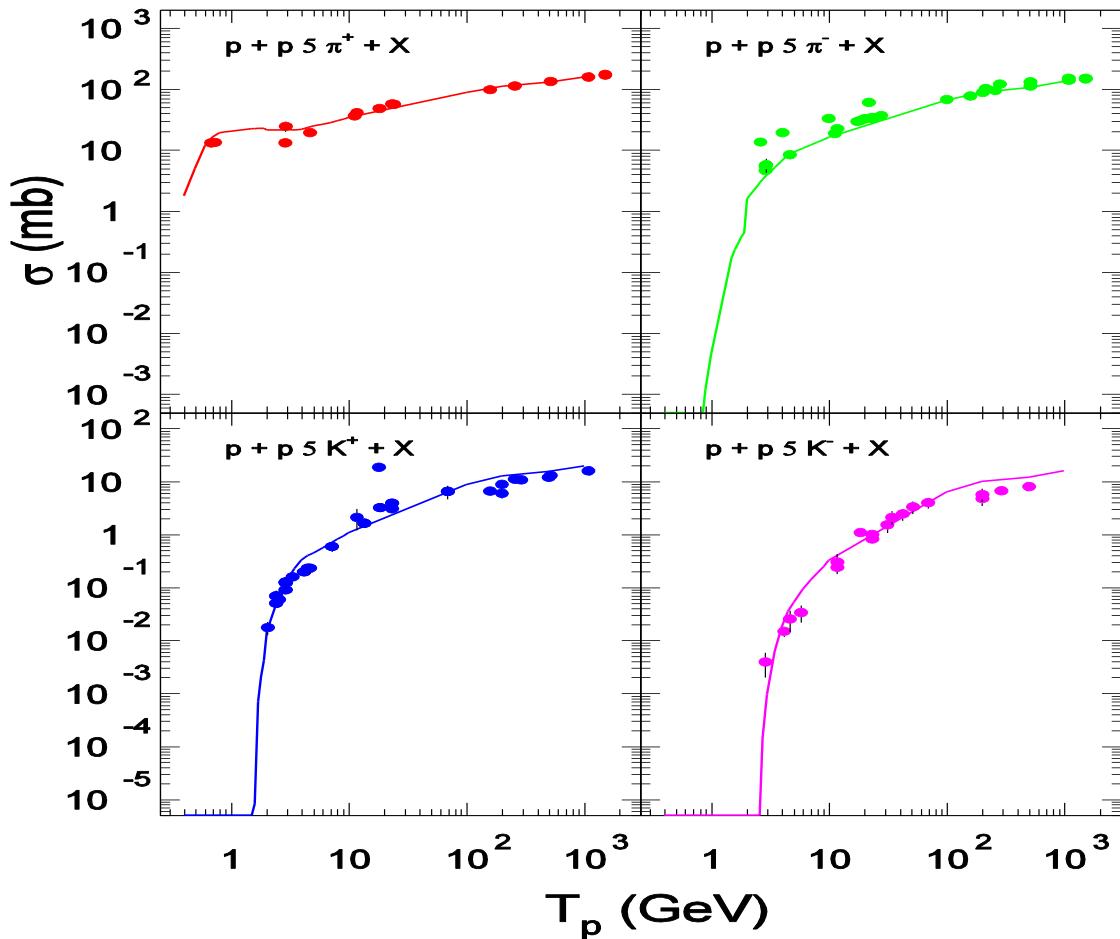

Momentum distribution of nucleons inside deuteron:

$N(q)dq = Cq^2dq/[\alpha^2 + q^2]^\beta$,
fitting experimental data

Phys. Rev. C65 (2002) 024306

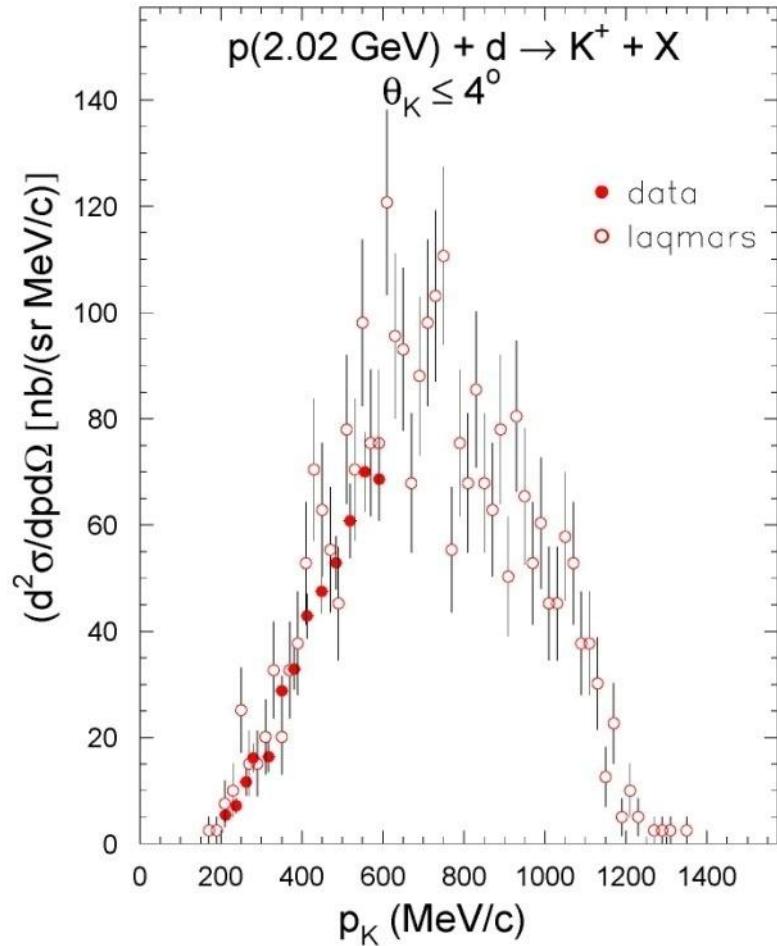

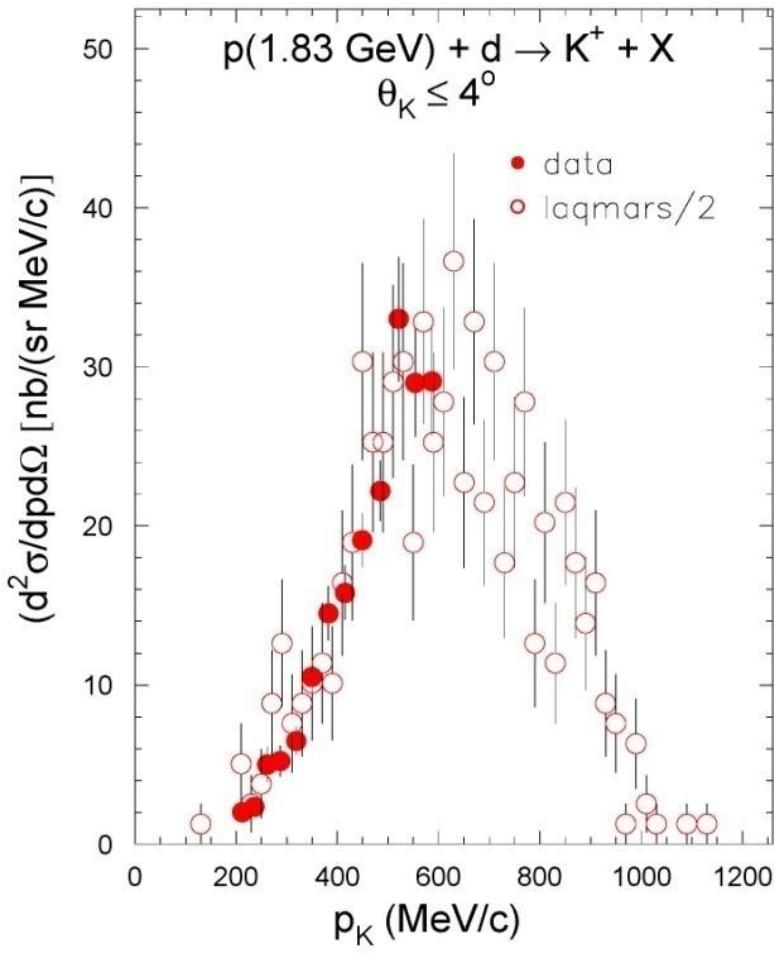

Benchmarking: Production xsec for p + p

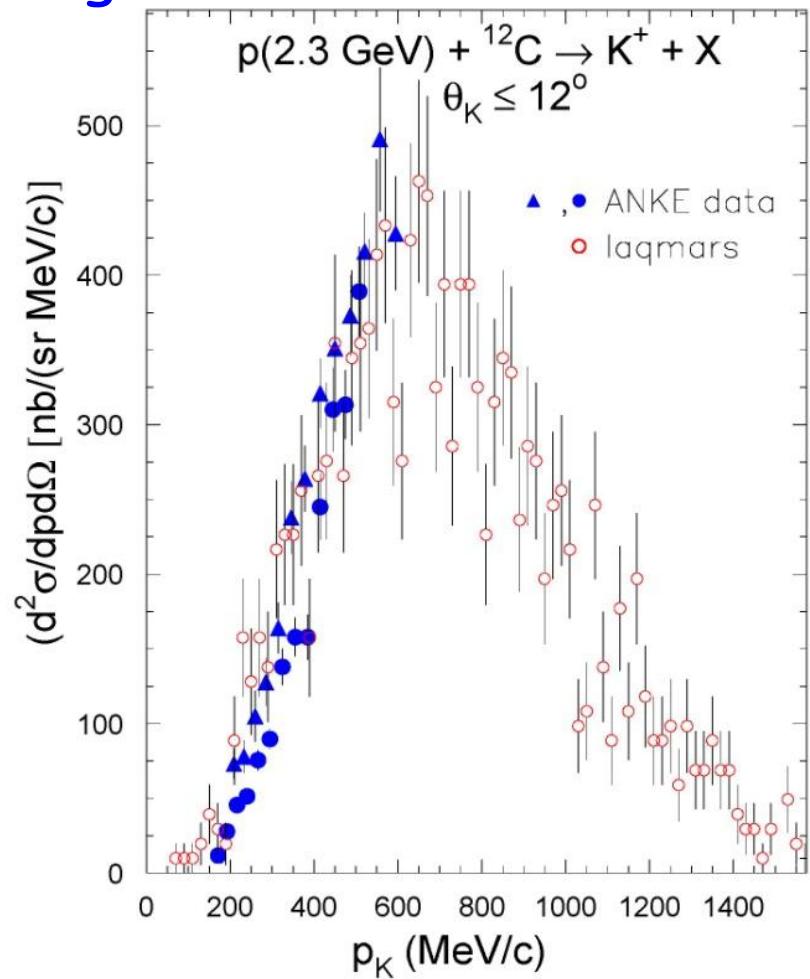

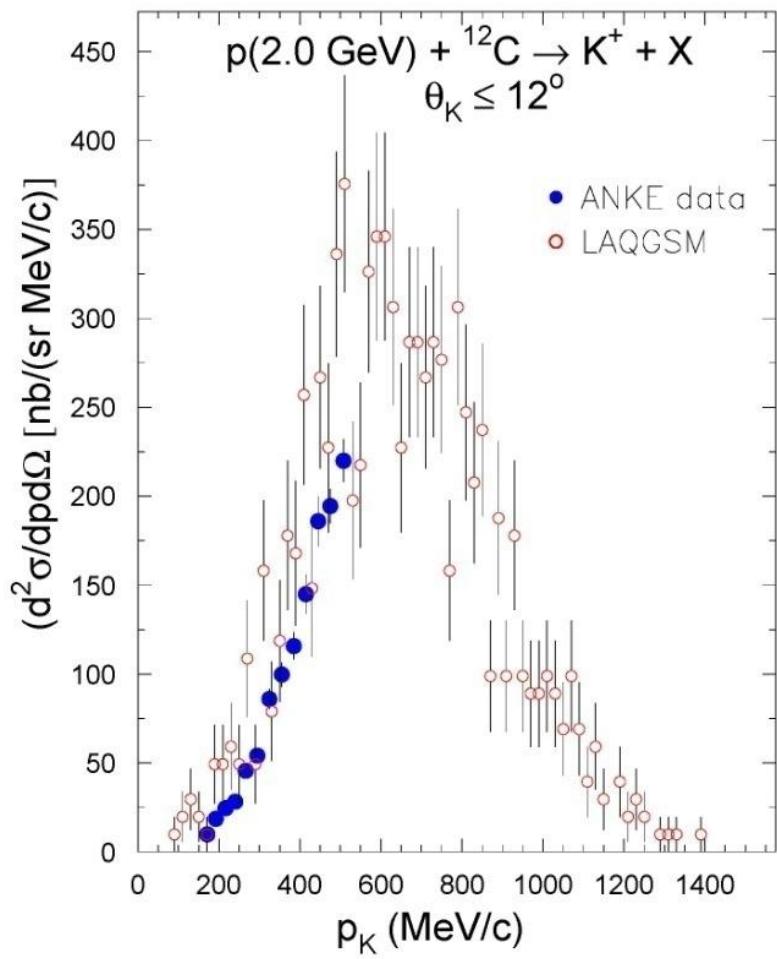

Benchmarking: $p\bar{d} \rightarrow K^+ X$ at 1.83 & 2.02 GeV

$\theta < 4$ deg

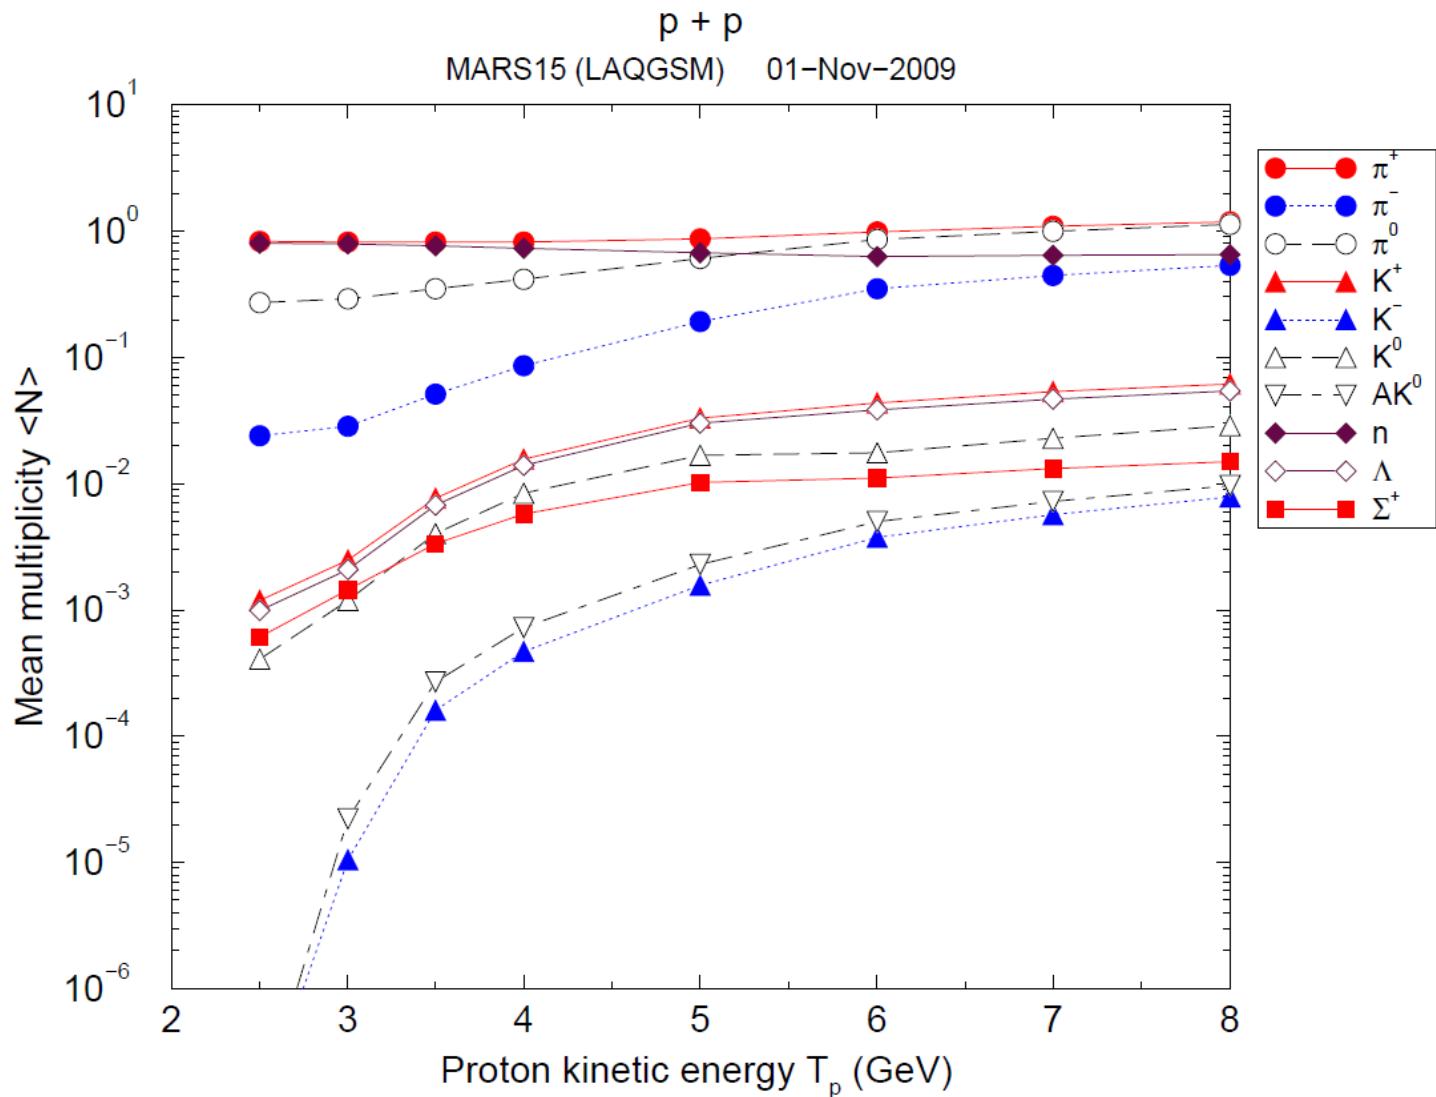

Benchmarking: $pC \rightarrow K^+ X$ at 2 & 2.3 GeV

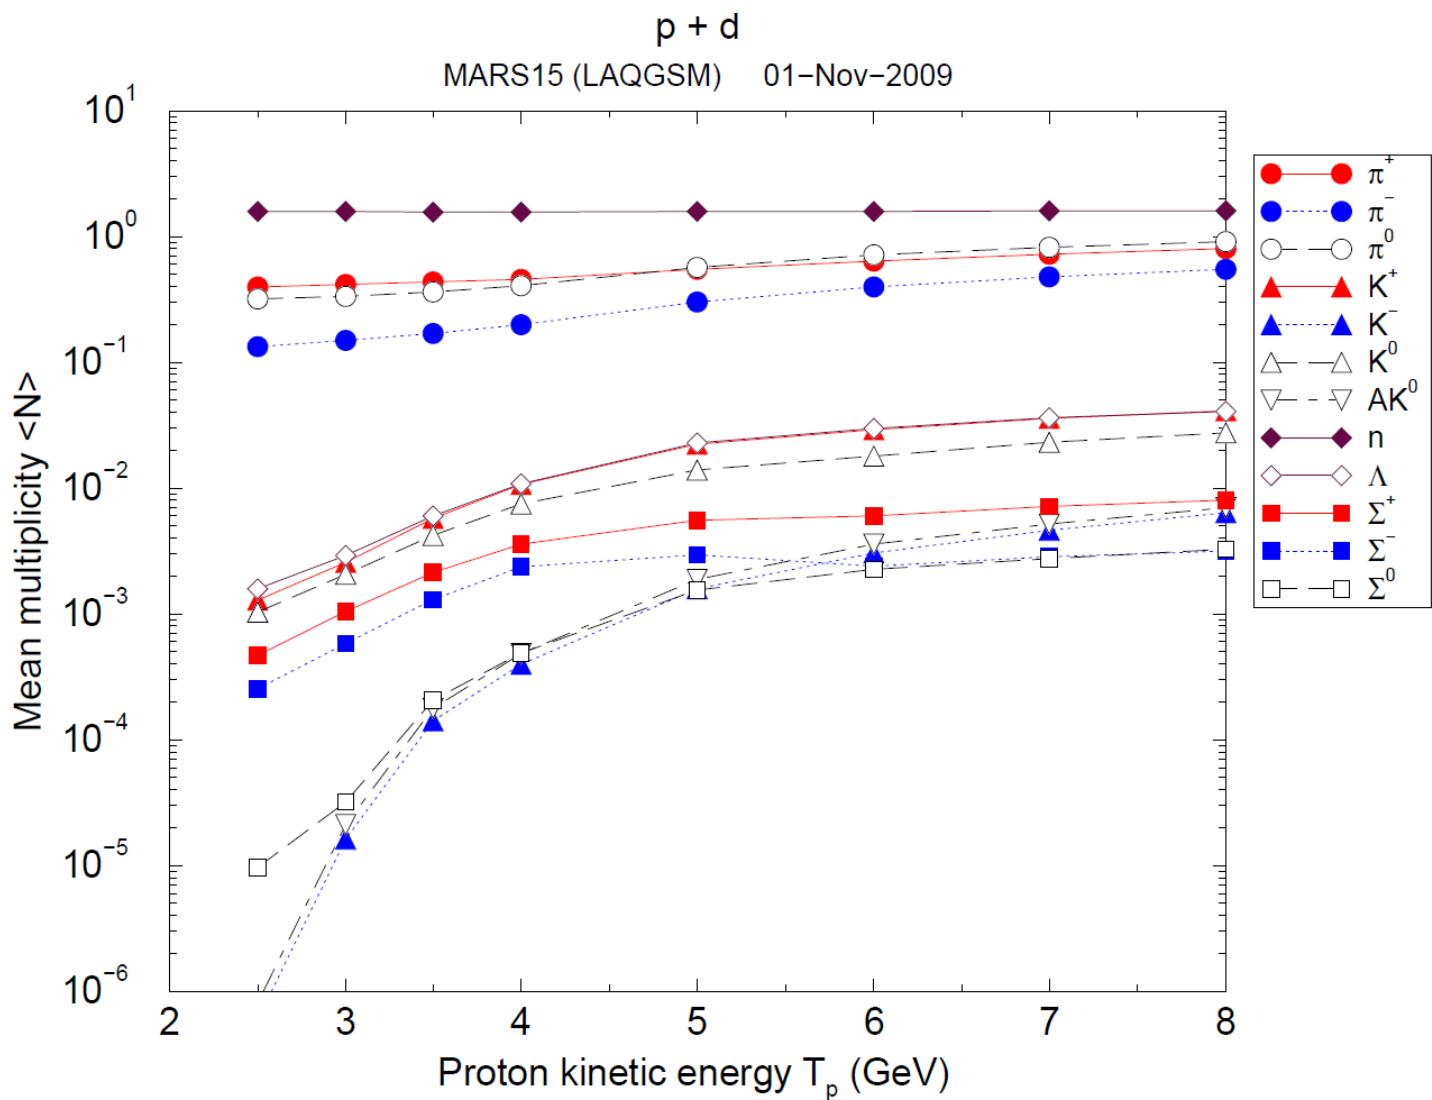

$\theta < 12$ deg

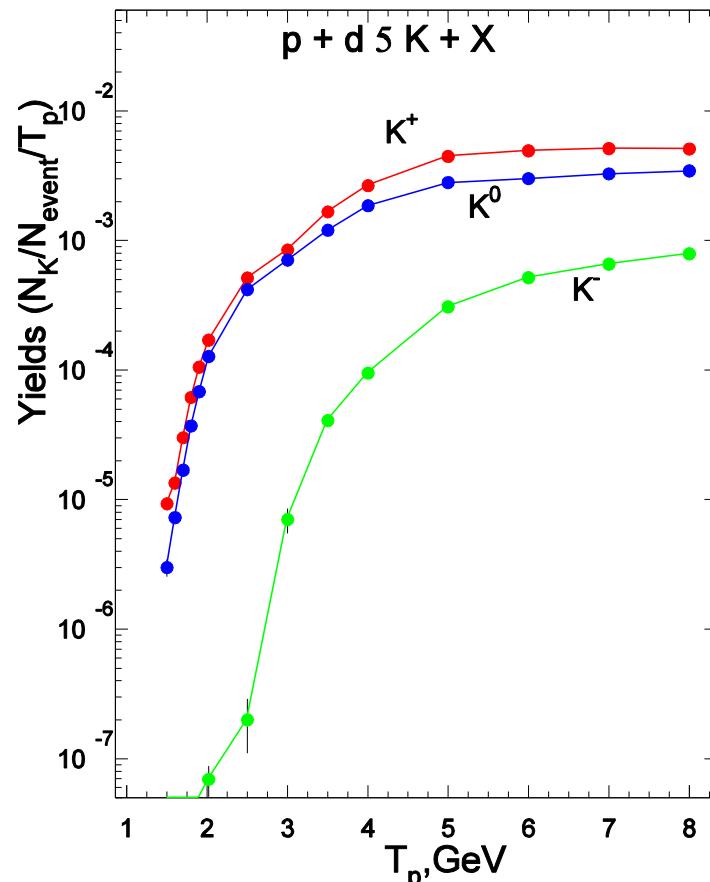

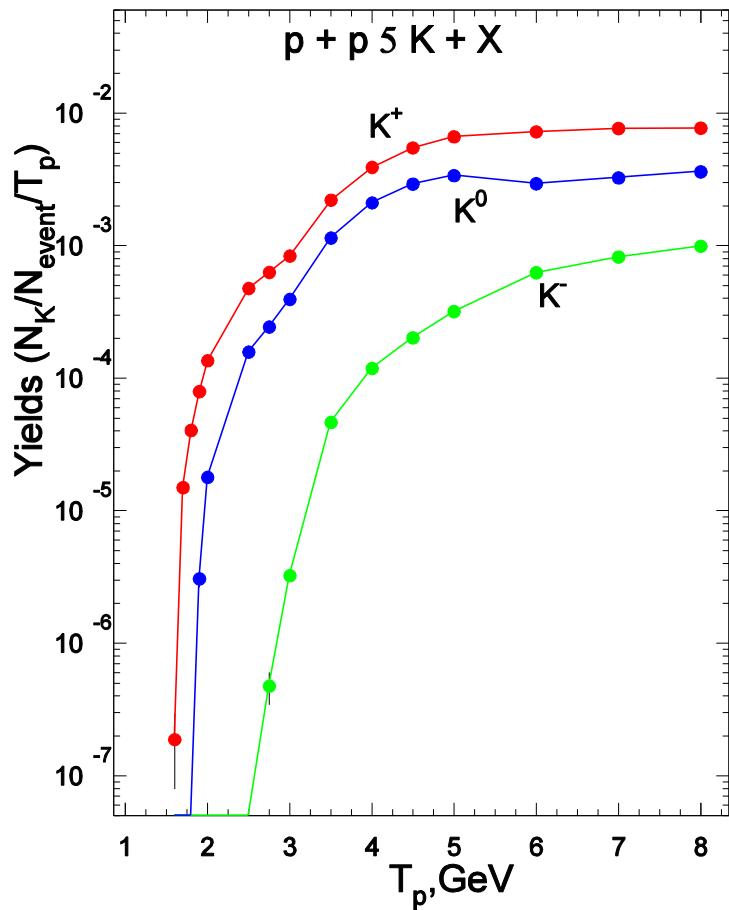

Mean Multiplicity for pp

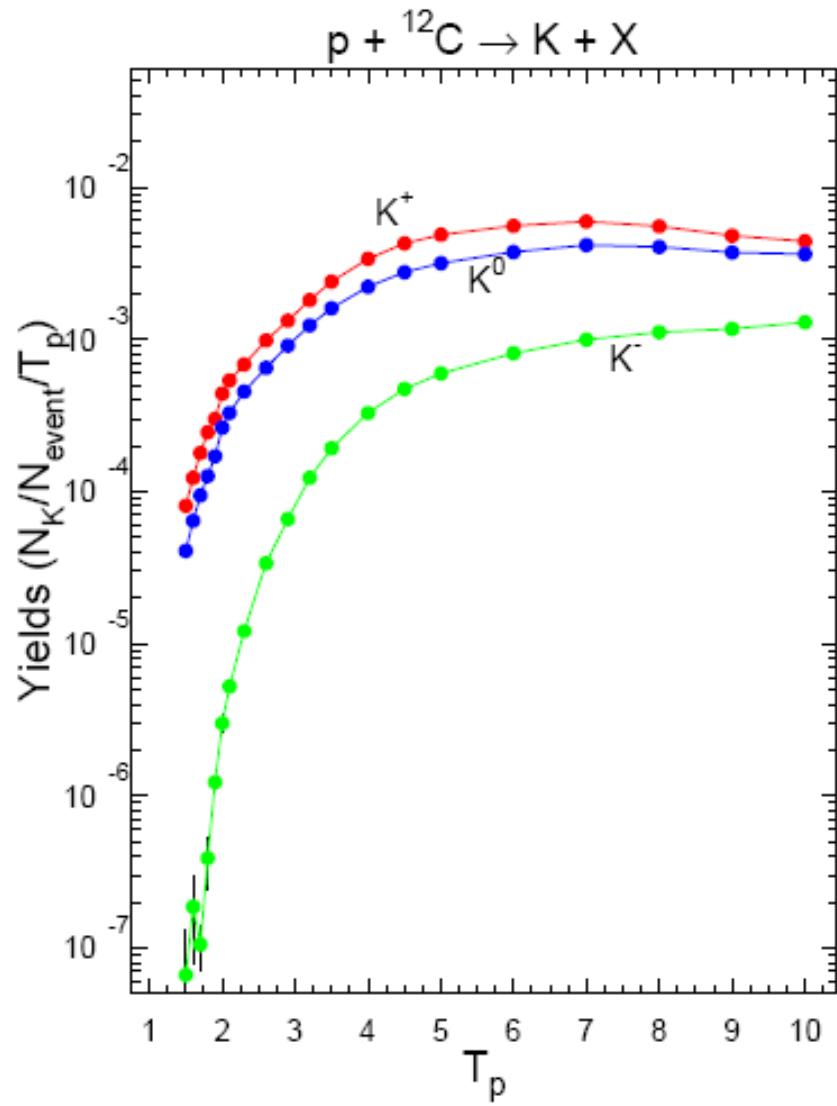

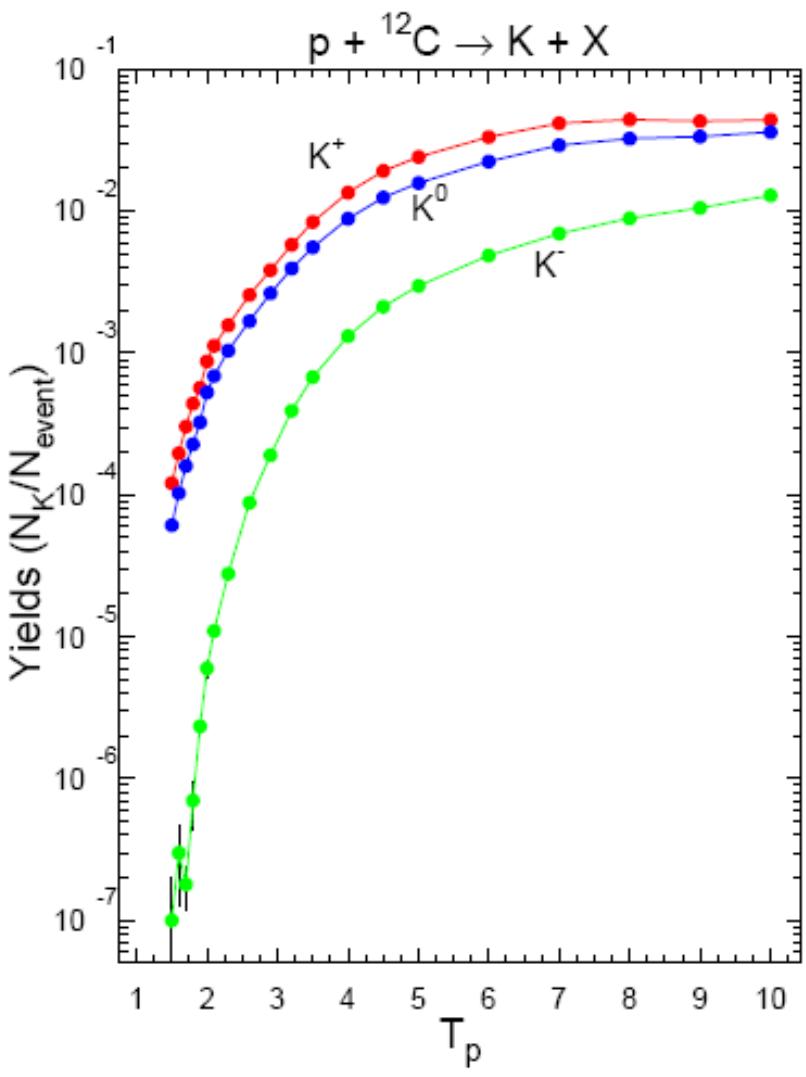

Mean Multiplicity for pd

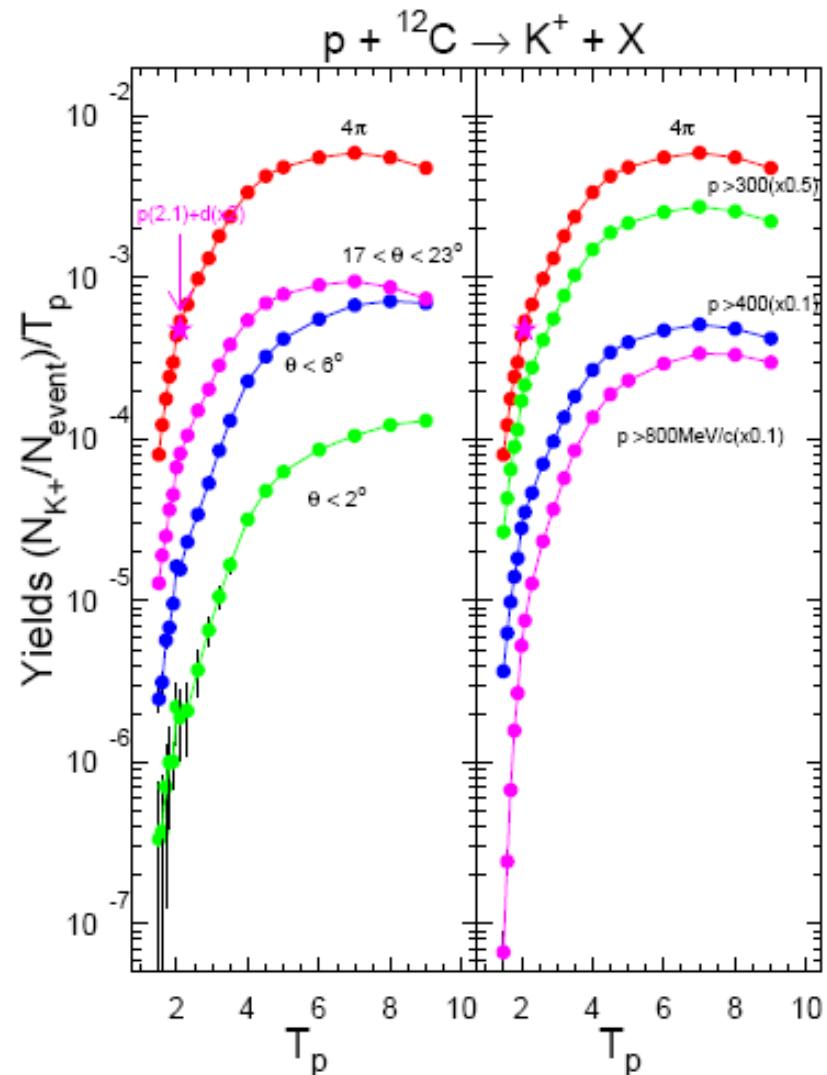

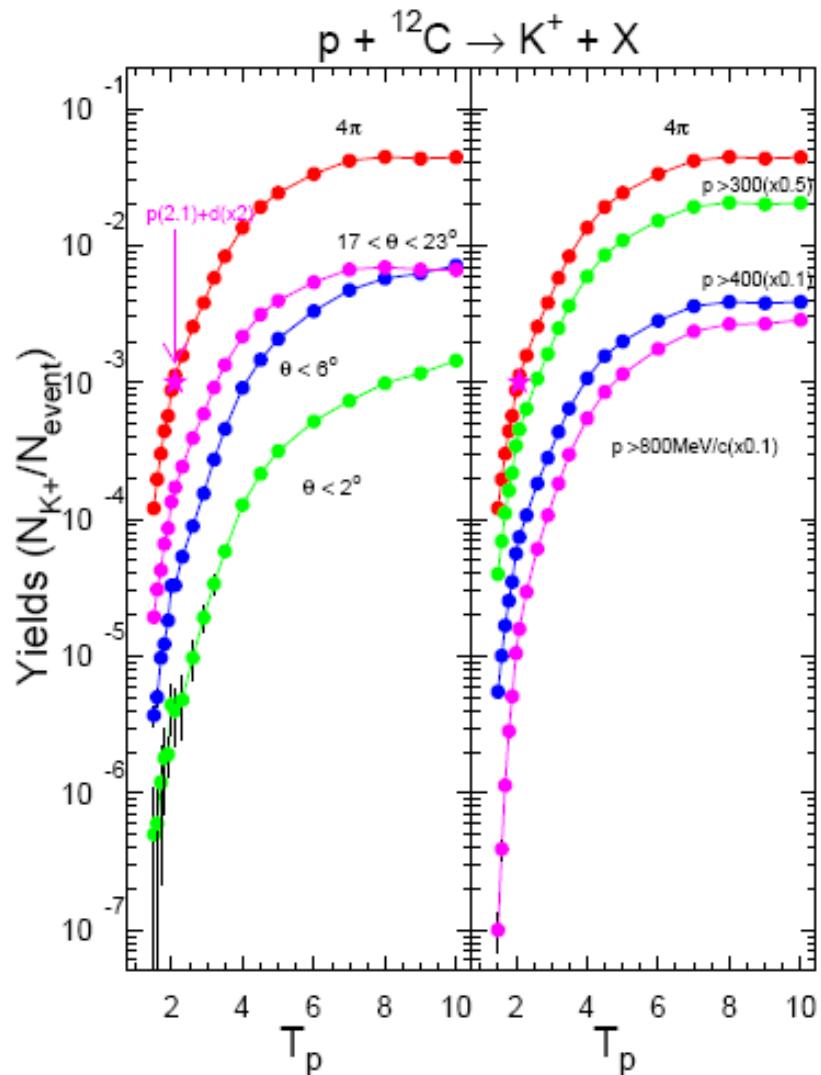

Kaon Yield per Proton Energy in pp and pd

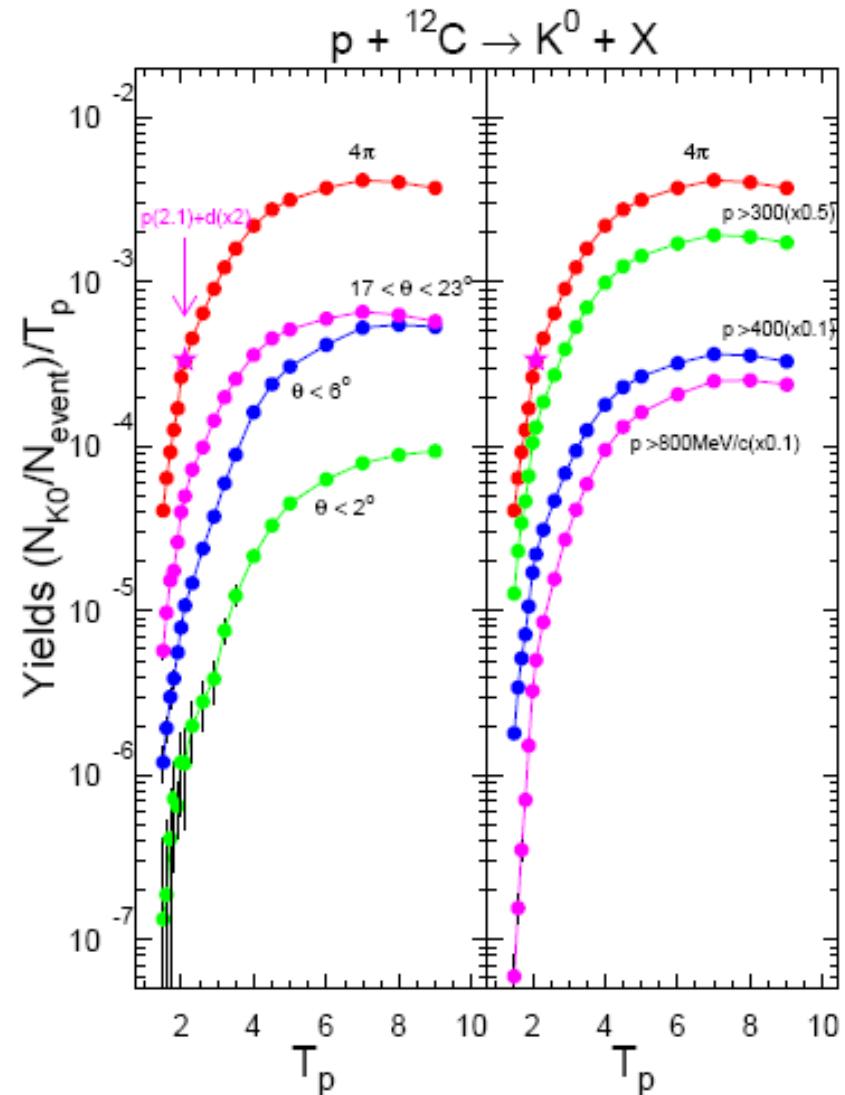

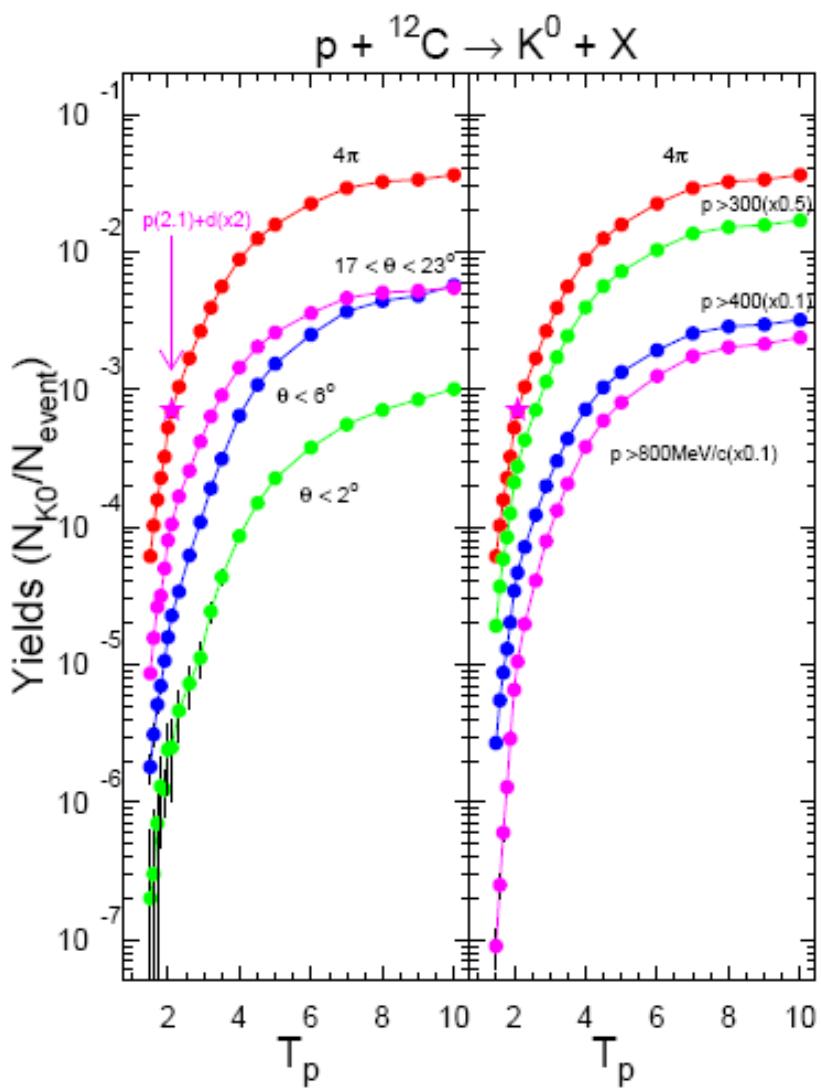

Kaon Yield and that per Proton Energy in pC

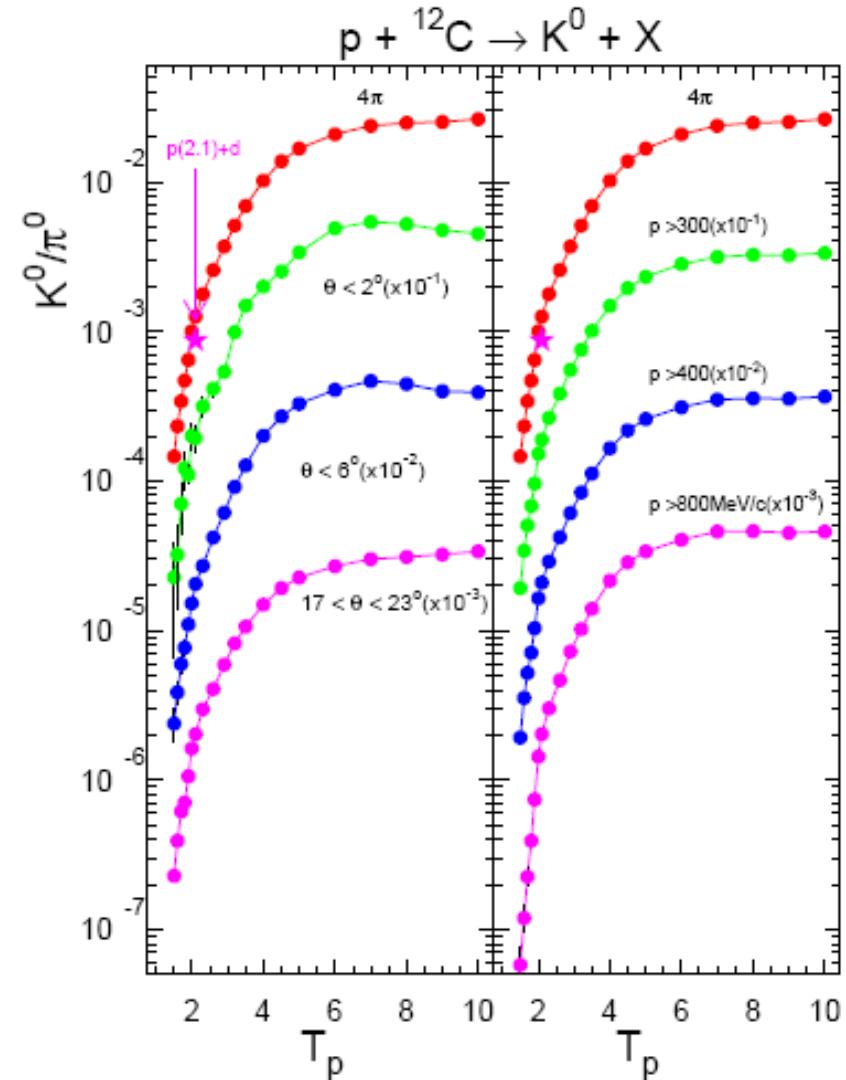

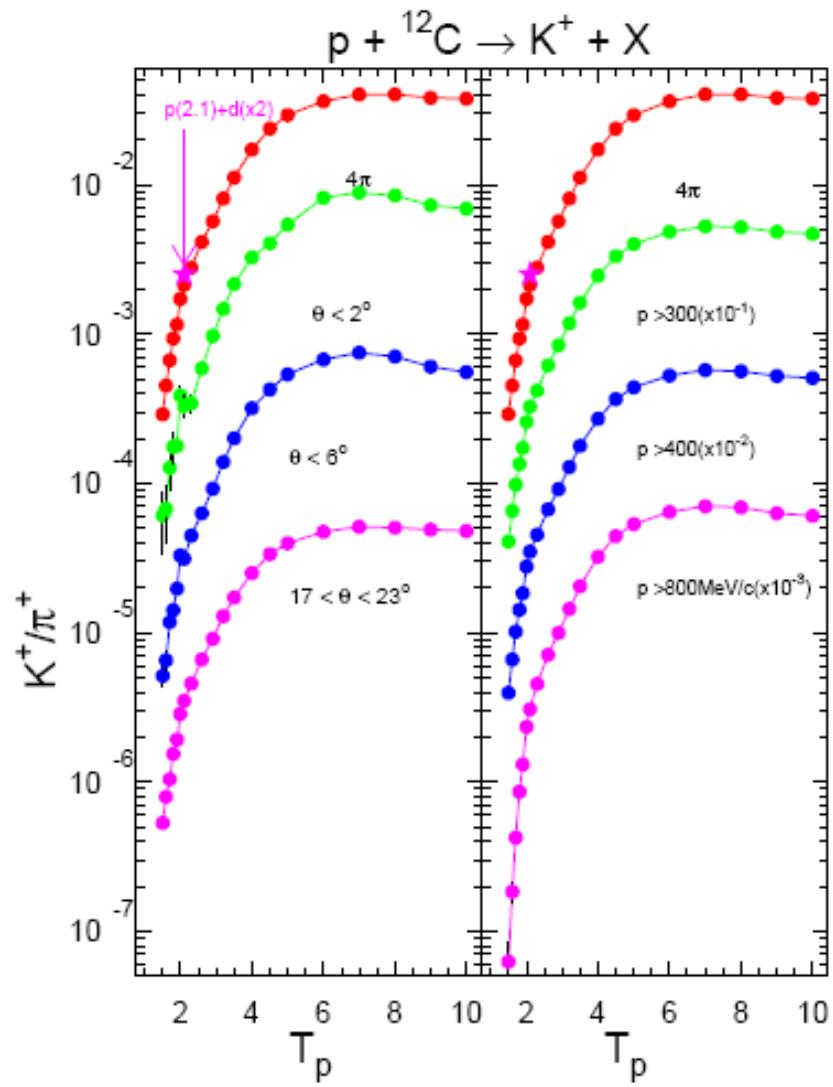

K⁺ Yield in pC in Various Kinematical Regions

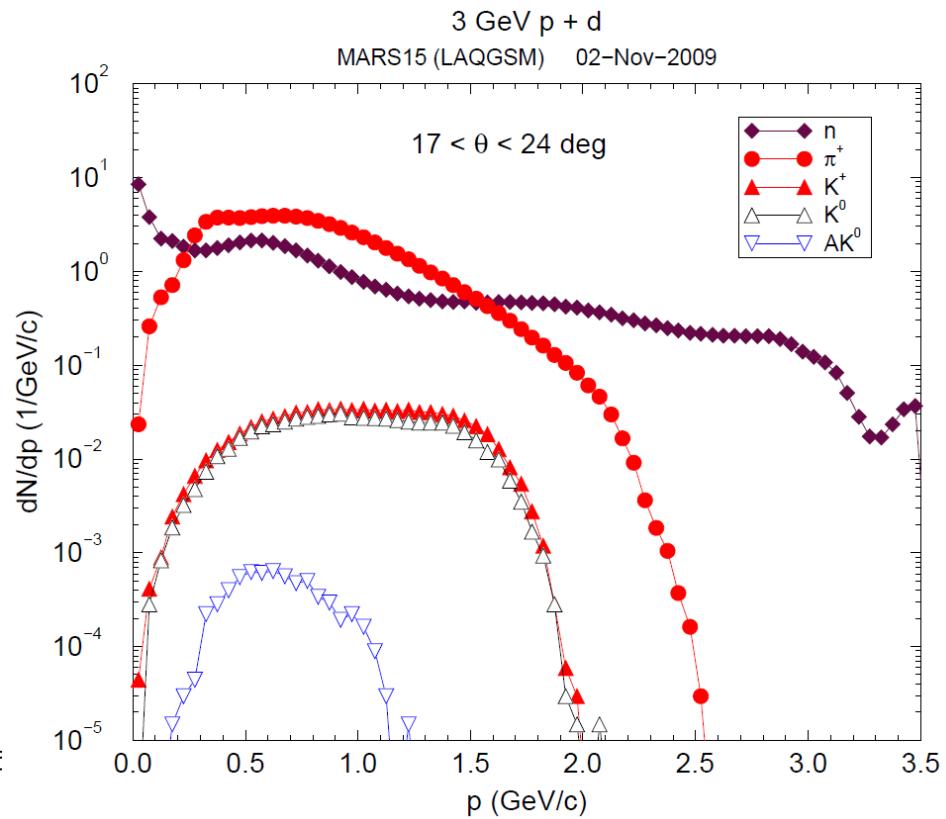

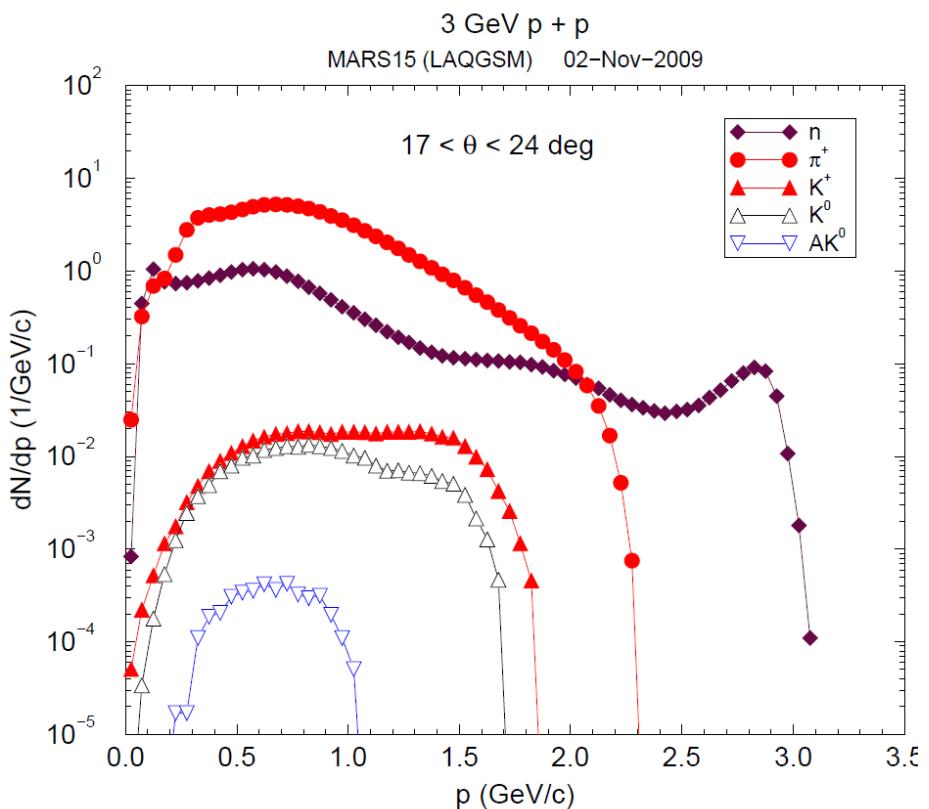

K⁰ Yield in pC in Various Kinematical Regions

K/ π Ratio in pC in Various Kinematical Regions

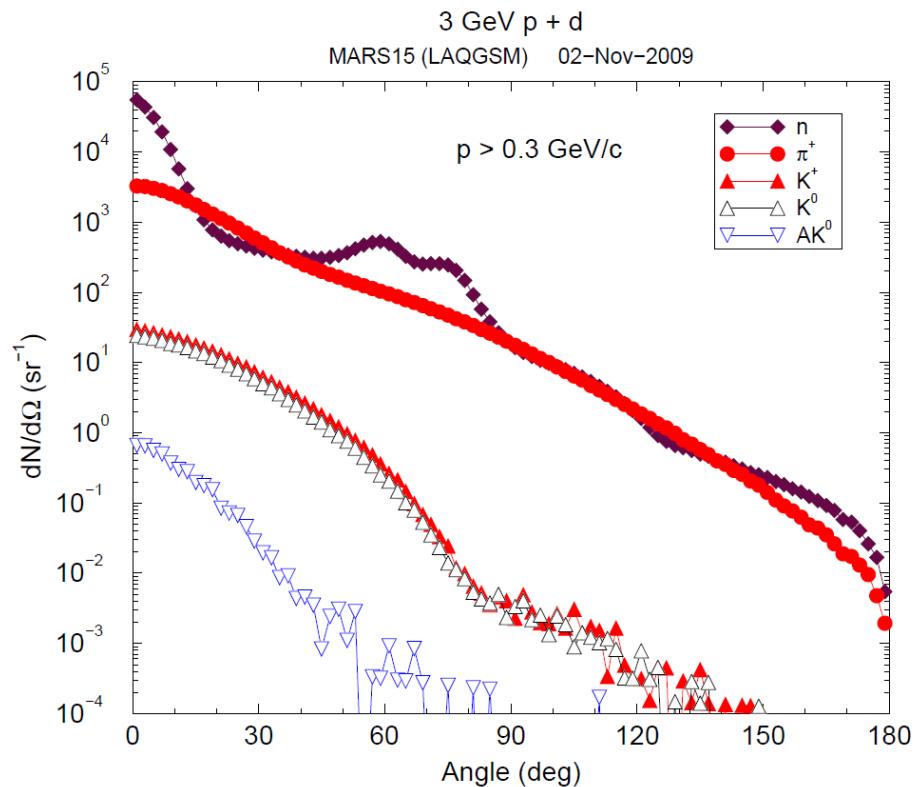

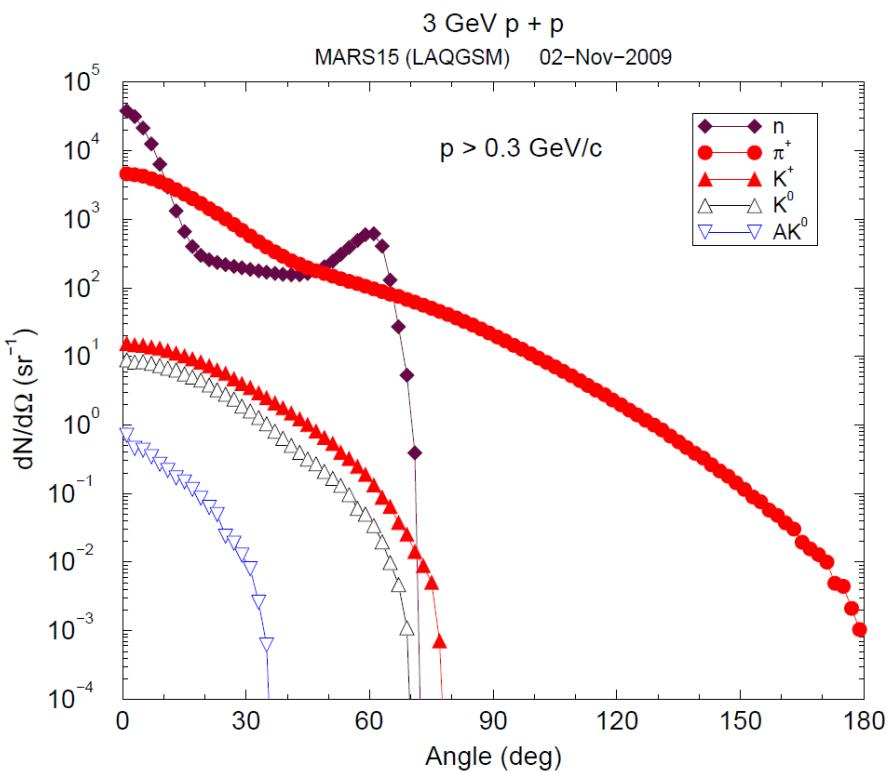

Momentum Spectra in pp and pd at 3 GeV

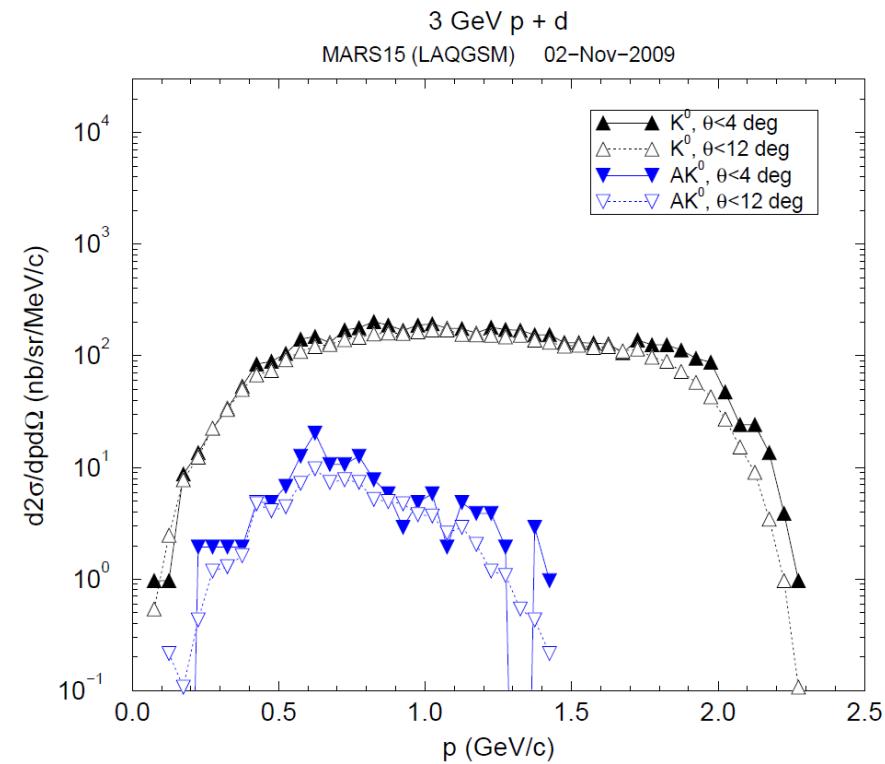

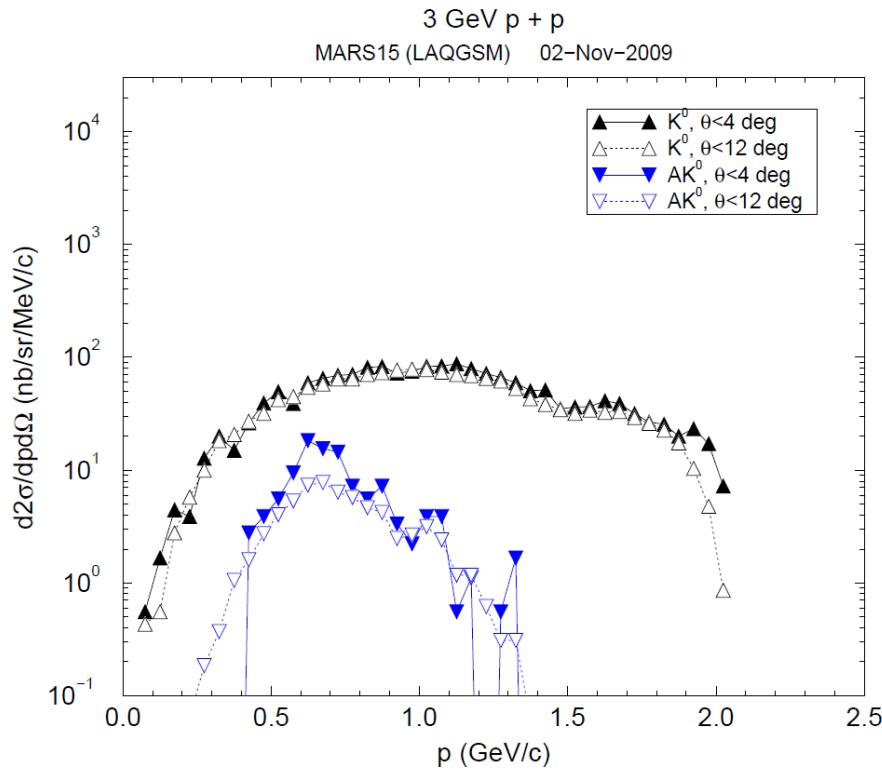

$17 < \theta < 24$ deg

Angular Distributions in pp and pd at 3 GeV

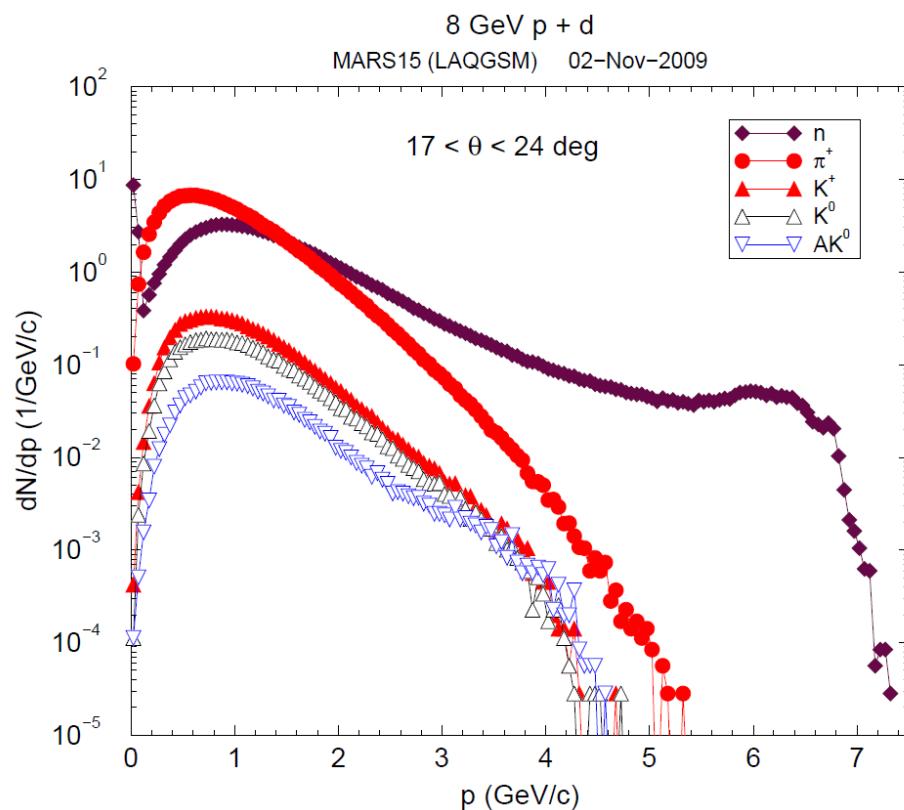

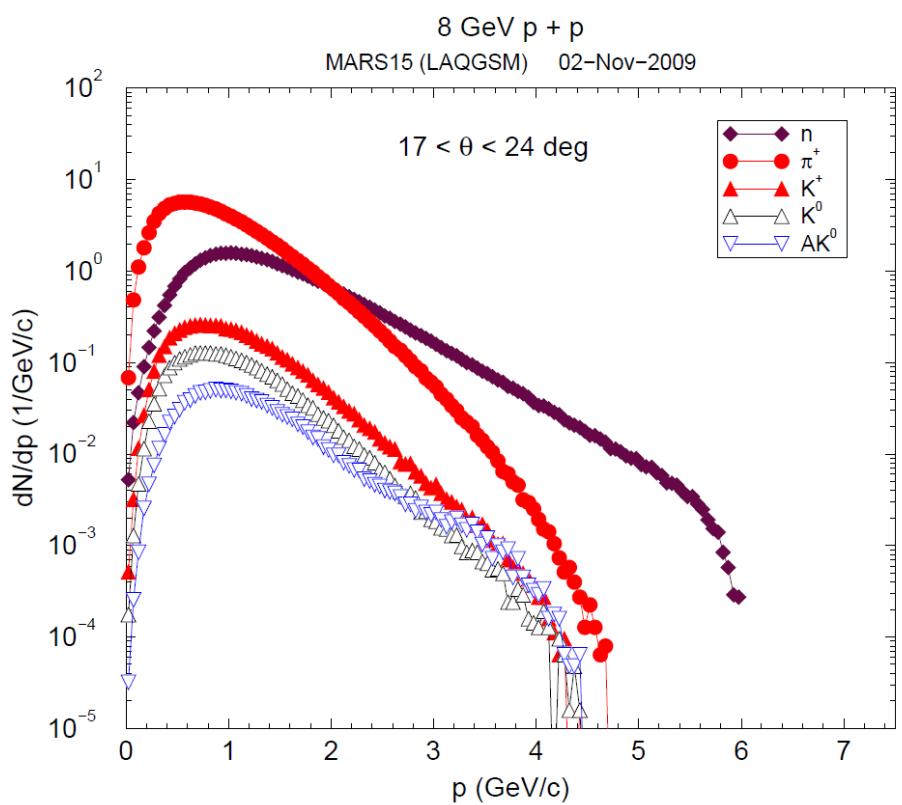

$P > 0.3 \text{ GeV}/c$

Neutral Kaon Double-Differential Cross-Sections in pp and pd at 3 GeV

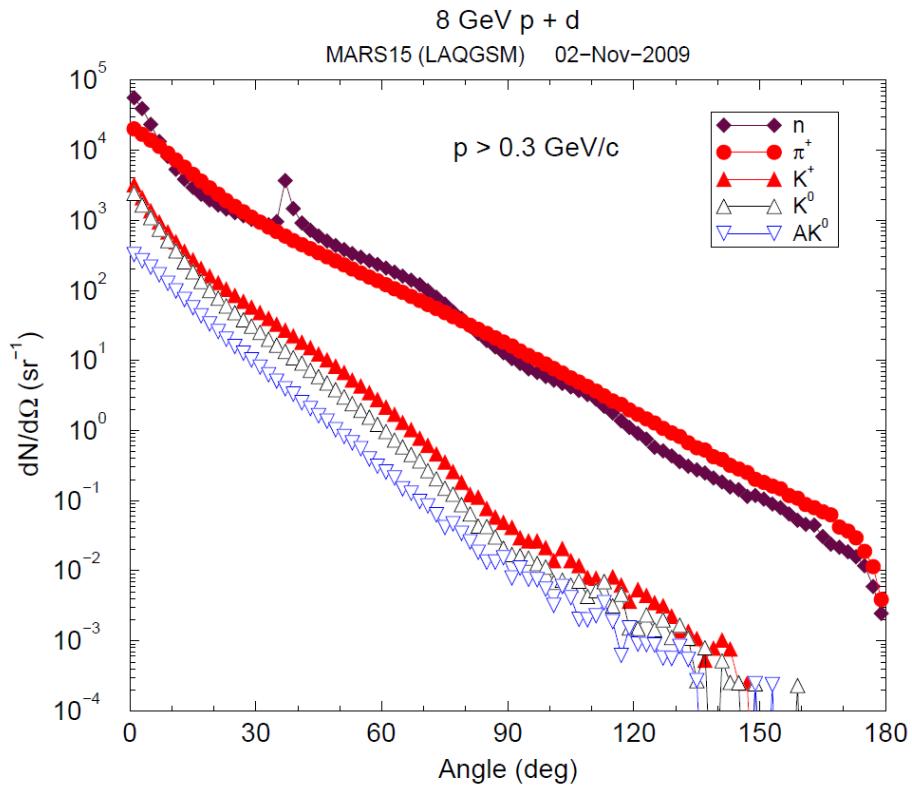

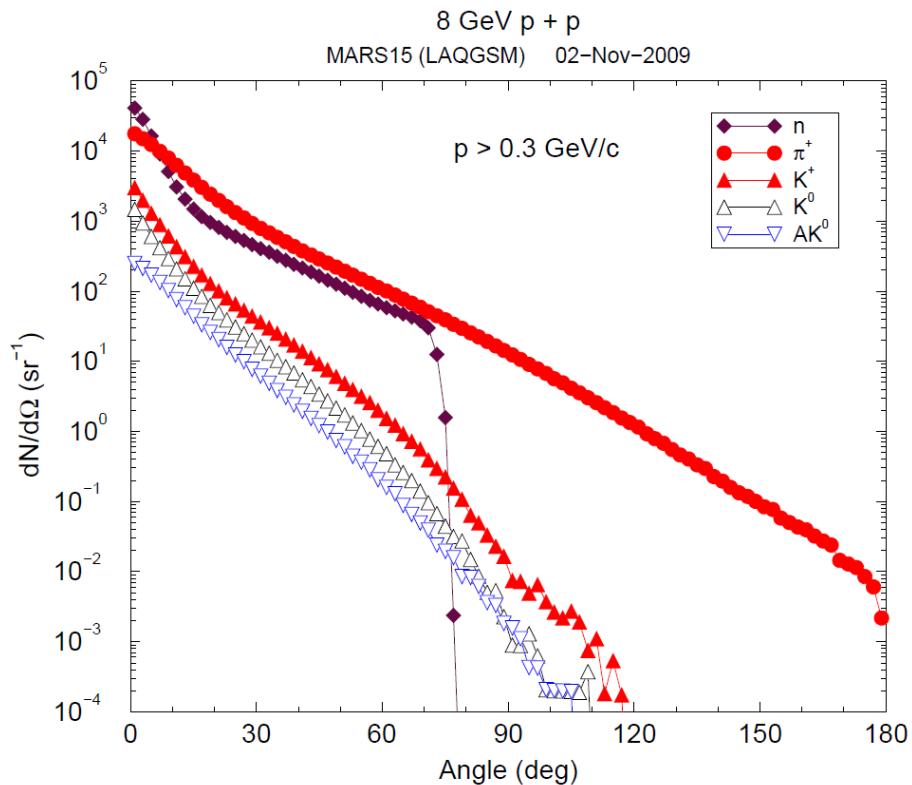

$\theta < 4 \text{ deg}$ and $\theta < 12 \text{ deg}$

Momentum Spectra in pp and pd at 8 GeV

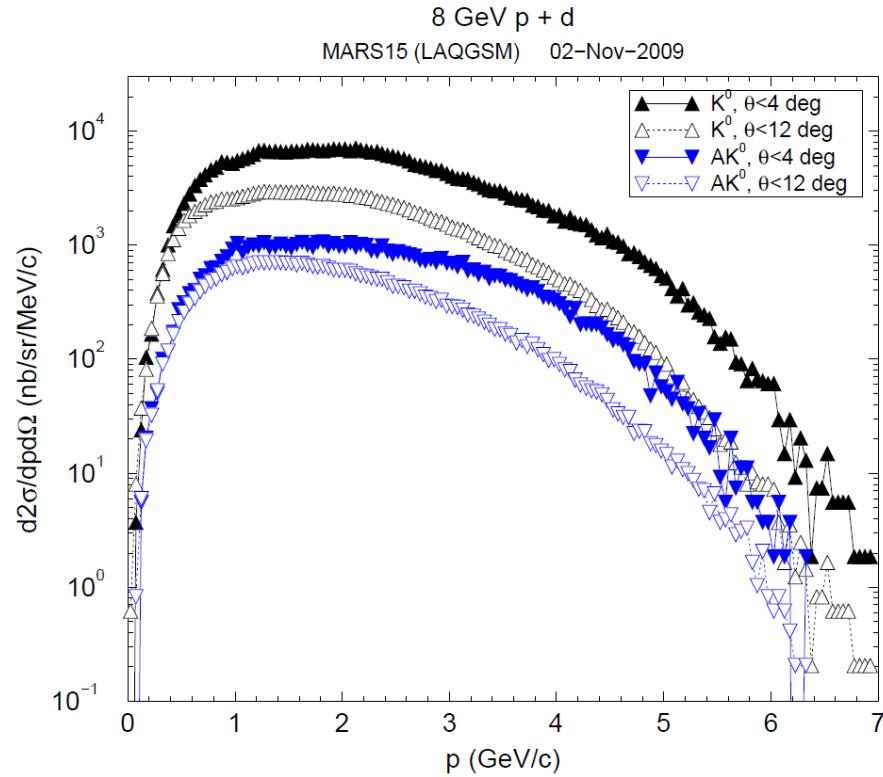

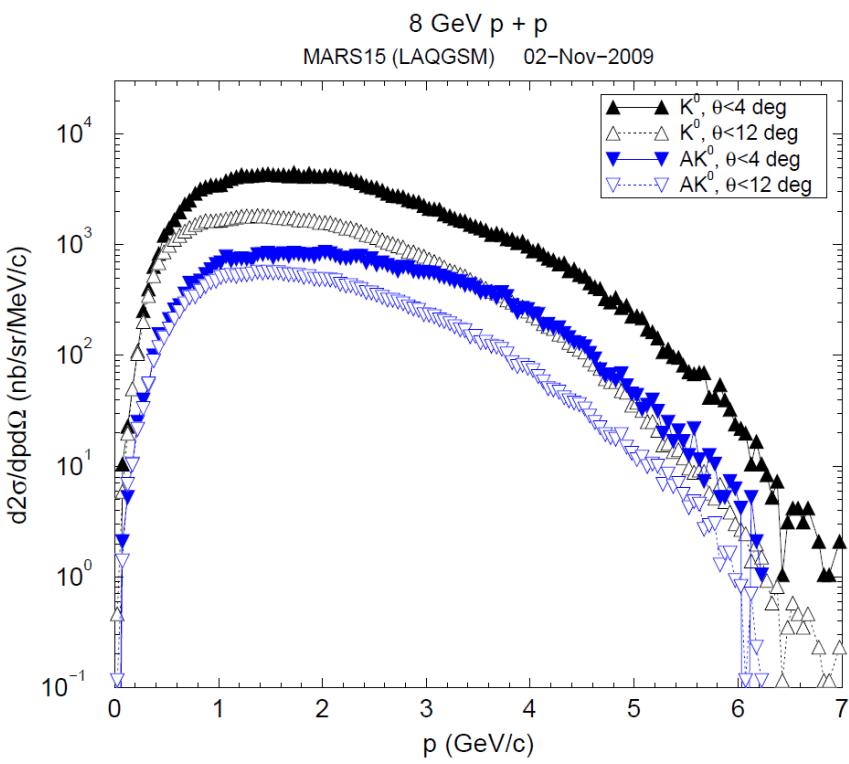

$17 < \theta < 24$ deg

Angular Distributions in pp and pd at 8 GeV

$P > 0.3 \text{ GeV}/c$

Neutral Kaon Double-Differential Cross-Sections in pp and pd at 8 GeV

$\theta < 4 \text{ deg}$ and $\theta < 12 \text{ deg}$

Summary

- LAQGSM09 model has recently been enhanced, benchmarked and updated in MARS15 at $1 < T_p < 8$ GeV with a focus on consistent particle production description for:
 - Kaon, hyperon and nucleon production on hydrogen, deuterium and other light nuclei in a near-threshold region.
 - Pion production at $0.1 < p < 0.3$ GeV/c on high-Z nuclei (Neutrino Factory and Muon Collider).
 - Pion production at $T < 40$ MeV on high-Z nuclei for (Mu2e).
- K^+/T_p and K^0/T_p on low-Z targets are almost energy-independent at $T_p \geq 4$ GeV, reaching a broad maximum at 6-7 GeV, same for K/π ratio; K^-/T_p and AK^0/T_p are practically independent of T_p at $T_p \geq 6$ GeV. Accelerator, targetry and collection constraints need to be taken into account while choosing beam energy at $T_p \geq 4$ GeV.
- First runs with MARS15 (LAQGSM09) have been performed for realistic thick targets and capture systems.
